

Veterinary Report

"Sessantesimo"

Bay 2008 Broodmare

985100010935457

8<sup>th</sup> May 2020

The above described mare was examined at Vinery Stud, today, 8<sup>th</sup> May 2020. The mare is currently sound at the walk and trot, she has an iodine wrap covering the sole but is on no treatment .

The mare had been noted to have an ongoing lameness of the right forelimb associated with a subsolar abscess. The subsolar abscess was routinely treated with a poultice, anti-inflammatories and antibiotics. Radiographs were taken on 8<sup>th</sup> April 2020 with no significant radiographic changes of the pedal bone observed.

The long term prognosis for recovery from the subsolar abscess is good.
